

Field Size and Per-Race Wagering Determinants

**Steve Koch
Vice President – Racing
Woodbine Entertainment Group**

**Global Symposium on Racing & Gaming
December 9, 2014**

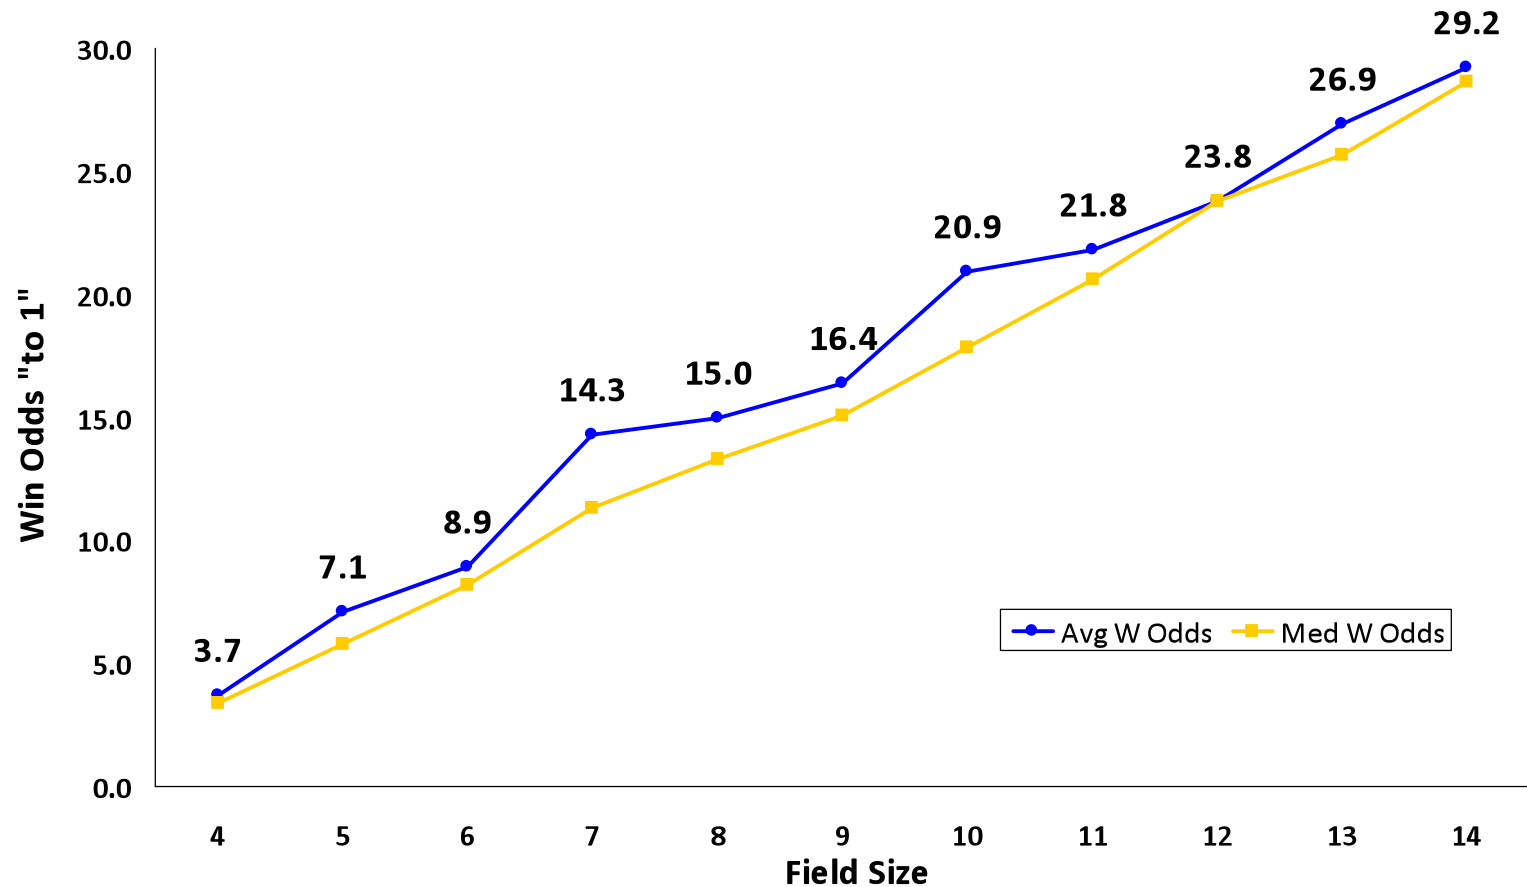

Average & Median Wager per Field Size

Woodbine 2014

Average & Median Win Odds per Field Size

Woodbine 2014

Econometric Analysis

- Woodbine 2012, \$454m total wager on 1,515 races
- Multivariate Regression – empirically verify which variables are/not statistically meaningful to per-race wagering and isolate the true magnitude of these relationships.
- Mathematically control for intertwined relationships. Model results are “all else held constant” (aka, ceteris paribus).
- Basic Model:
Per-Race Handle = f(Field Size, Race Quality, Surface, Race Conditions, Raceorder, Special Events, Market Timing, Market Distribution)
- Data complications include Serial Correlation and “Stacked” Correlation Effects

Handle Increases at a Diminishing Rate as Field Size Increases

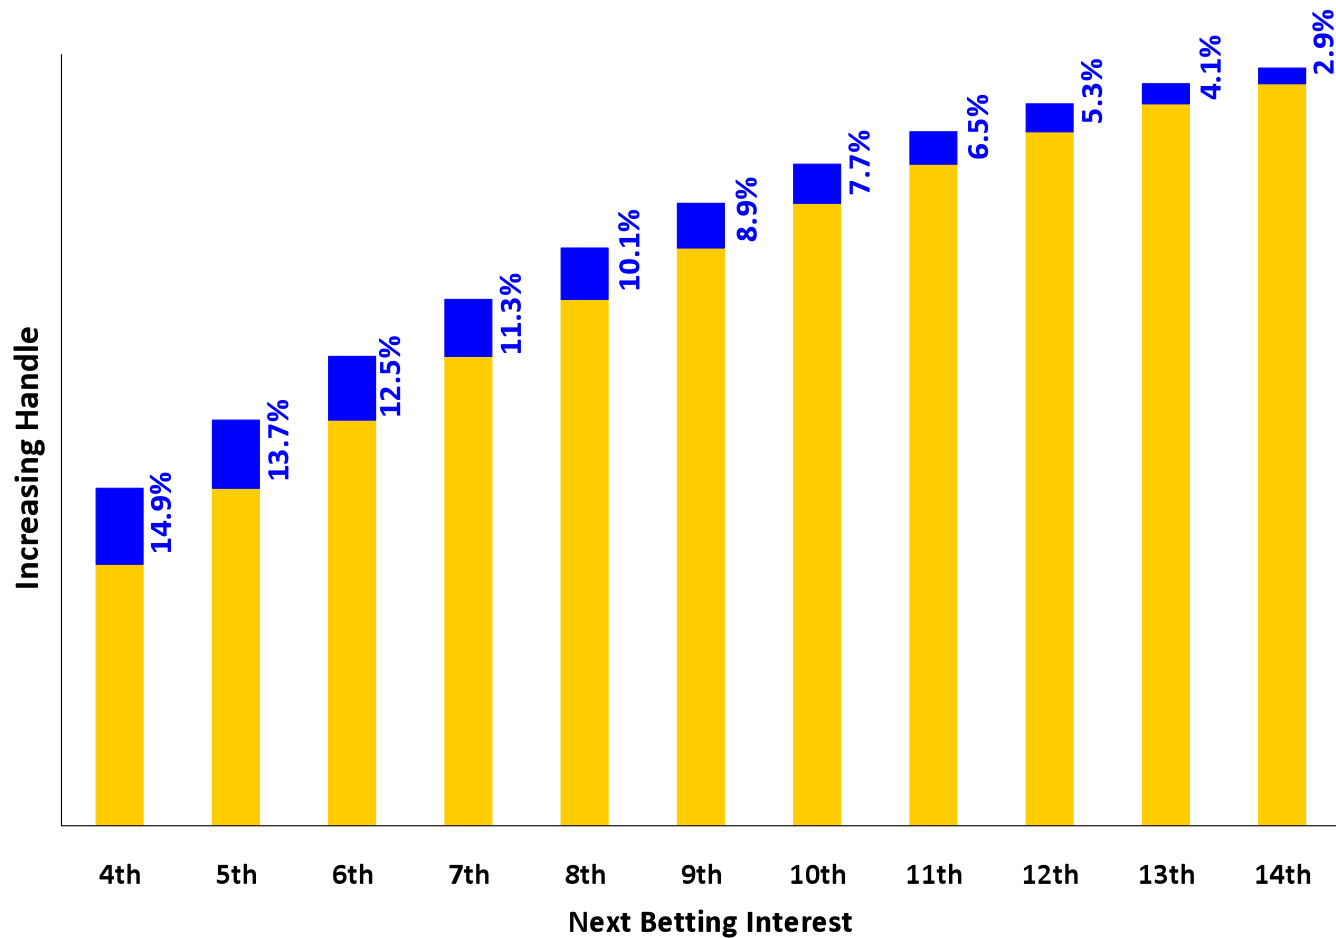

Average Wager per Field Size w/ Linear Trendline

Woodbine 2014

Diminishing Marginal Value of the Next Horse

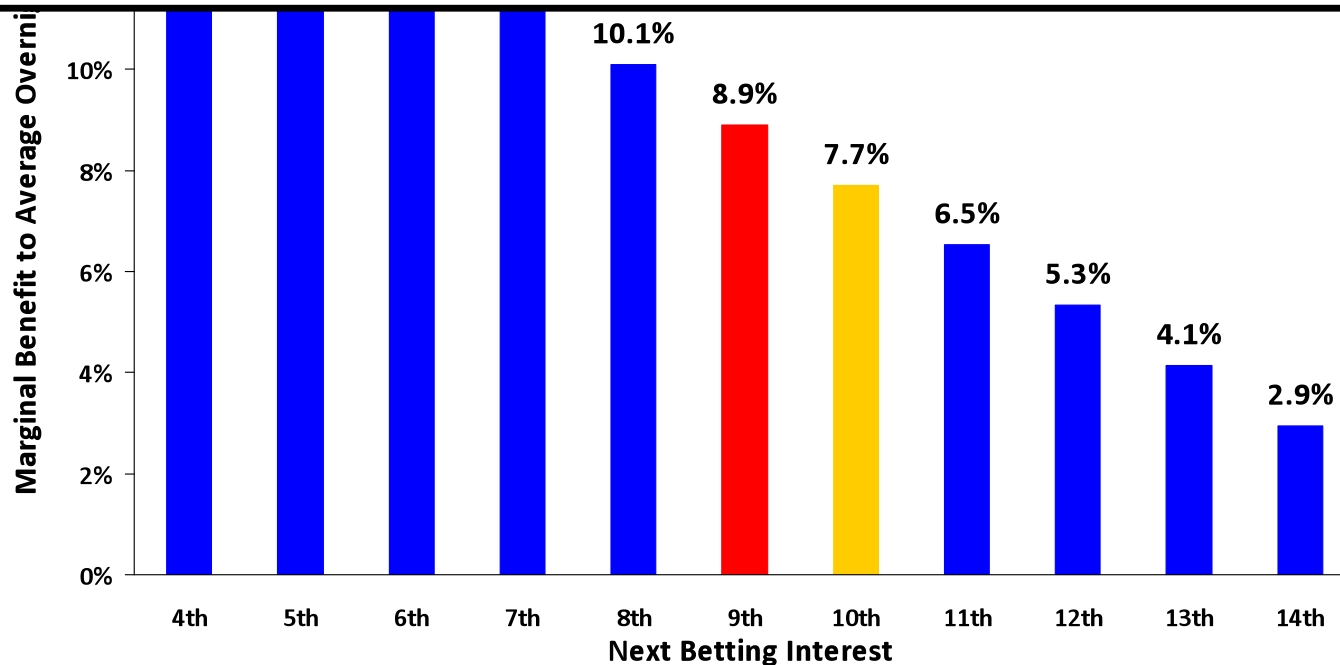

Diminishing Marginal Value of the Next Horse

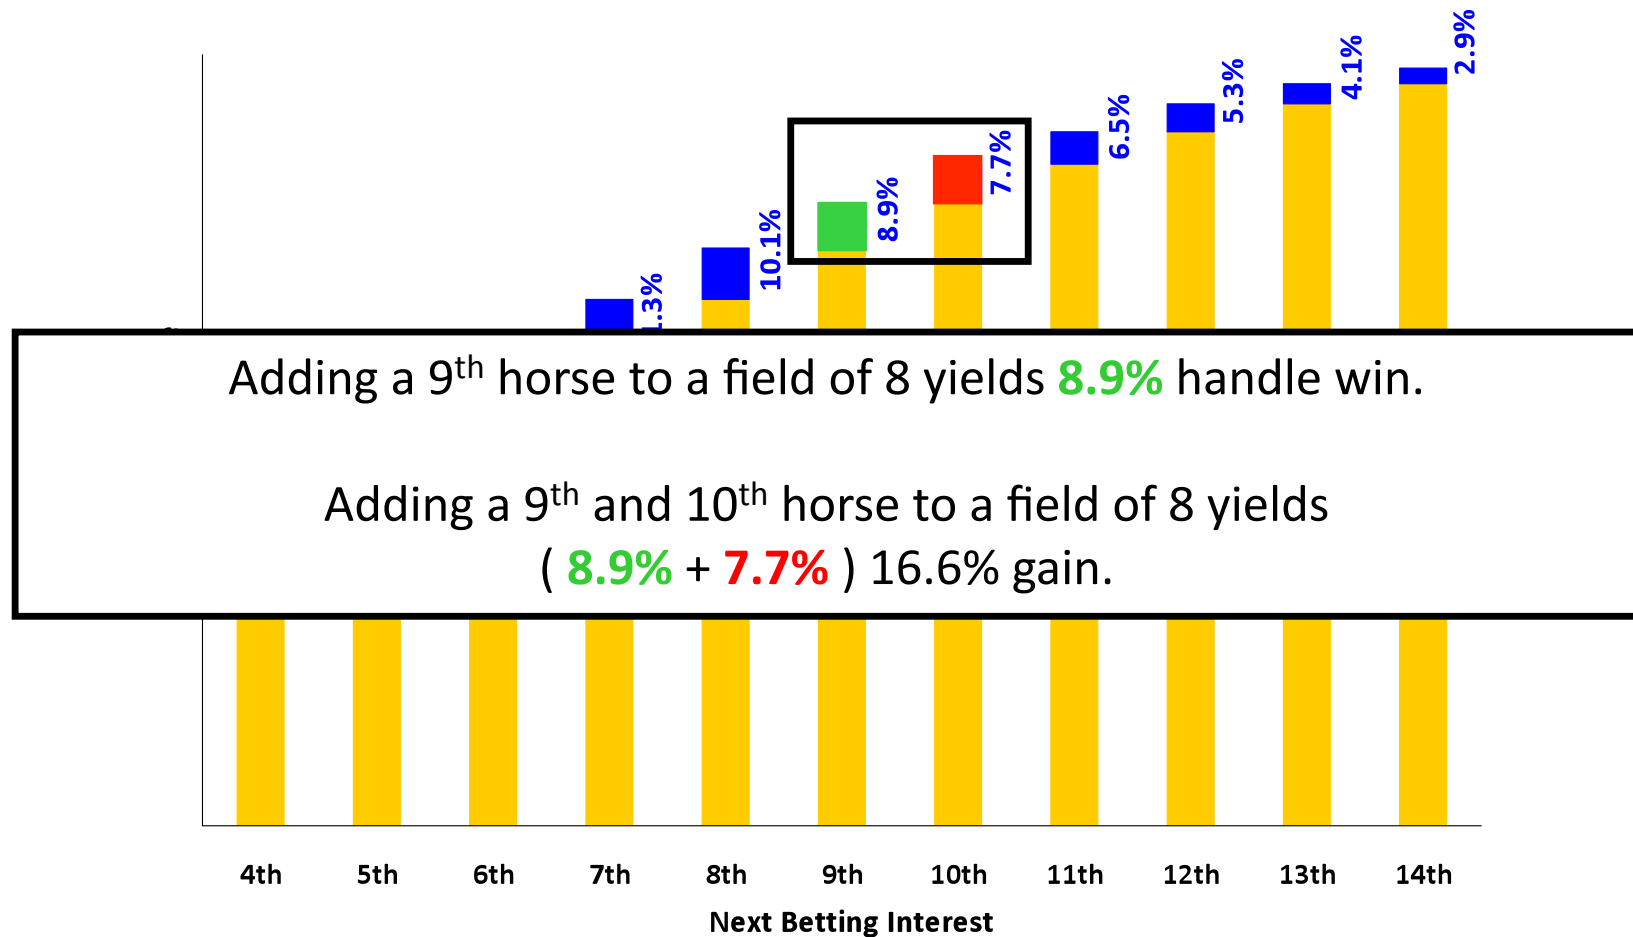

Diminishing Marginal Value of the Next Horse

Adding a 9th horse to a field of 8 yields **8.9%** handle win.

Adding a 9th and 10th horse to a field of 8 yields
(**8.9%** + **7.7%**) 16.6% gain.

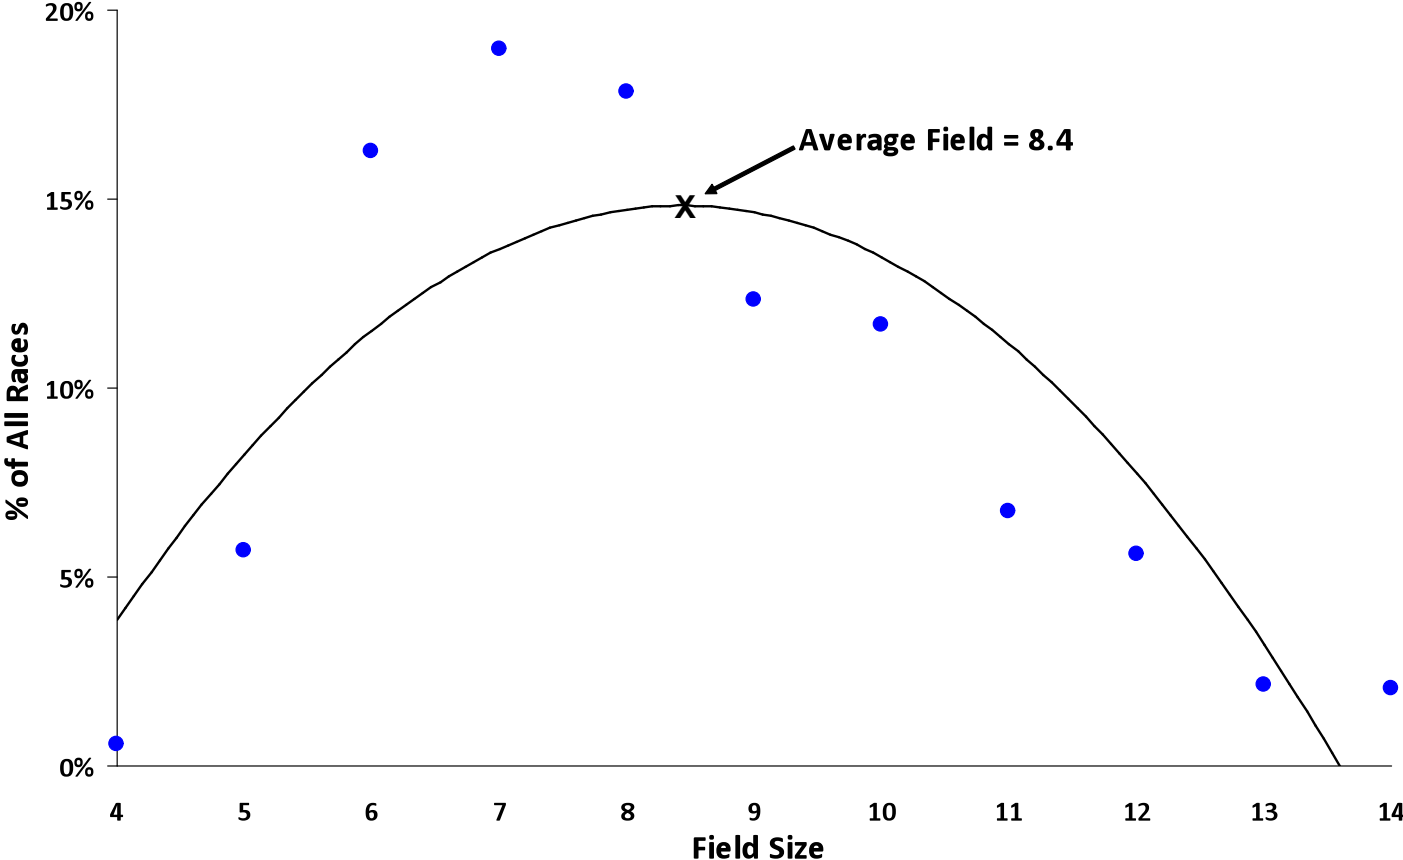

Diminishing Marginal Value of the Next Horse

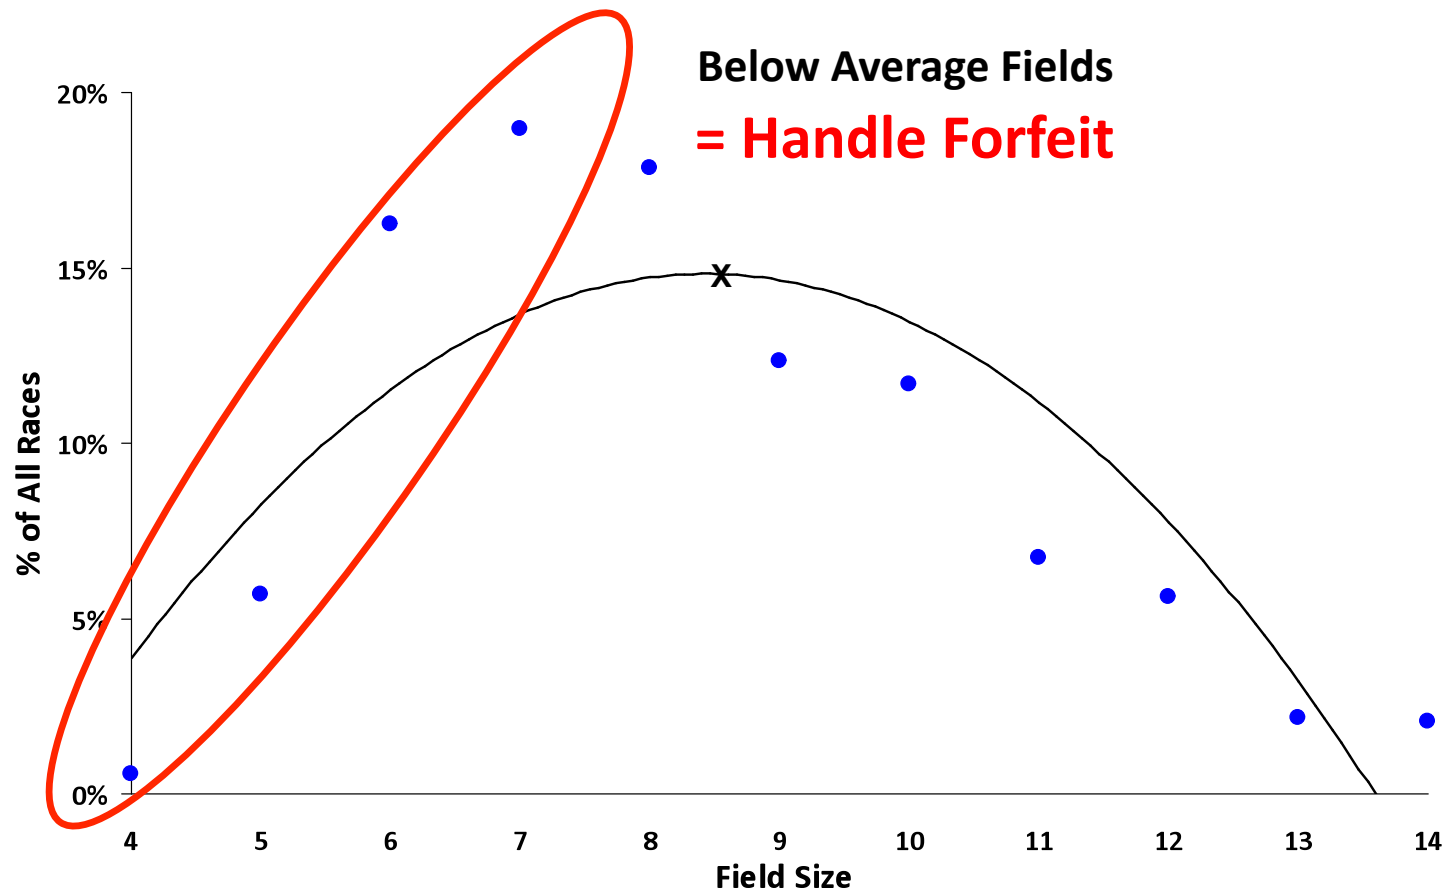

Distribution of Races w/r/t Field Size

Woodbine 2014

Diminishing Marginal Returns indicates a value-add opportunity.

If we smooth horse supply across all races so that every race is at the racemeet average (Woodbine = 8.4) then theoretical handle gains for same number of starters.

Race Competitiveness

- Overwhelming favourites drive down total wagering as that runner becomes a “key” in exotics.
- Although, the Show pool can increase – BridgeJumpers
- Various wagering studies have unsuccessfully attempted to model versions of a “Competitiveness Index”
- Overwhelming favourites increase as Field Size decreases. Econometric models consume this effect with the Field Size test.

But Field Size Isn't Everything...

Our customers reward us for Quality racing

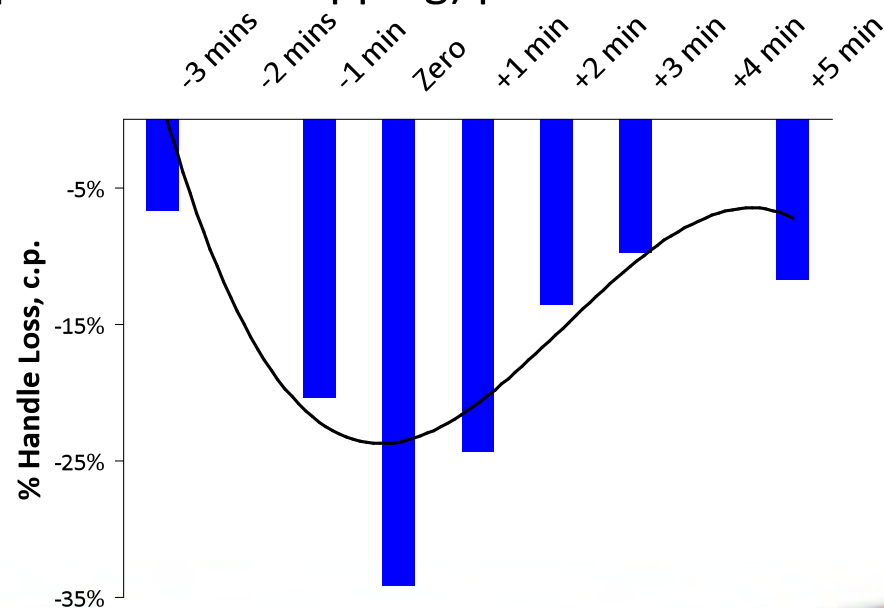

- Purse levels can proxy for Woodbine Overnight race conditions (purses unchanged for full year 2012)
- Each \$10k move up the purse scale brings 2.6% handle growth, c.p.
- Combine 2.6% wagering elasticity of race quality with the Diminishing Returns to Field Size...

Heat Mapping Quality vs Quantity

Purse Value	Bet Interests			Avg Field = 8.4									
	3	4	5	6	7	8	9	10	11	12	13	14	
\$20,000	33	47	61	74	85	95	104	112	118	123	128	131	
Claiming \$16k \$25,000	34	49	62	75	86	96	105	113	119	125	129	132	
\$30,000	35	50	64	76	87	98	106	114	121	126	130	133	
Claiming \$25k \$35,000	36	51	65	77	89	99	108	115	122	127	131	134	
Median Overnight \$40,000	38	52	66	79	90	100	109	117	123	128	133	136	
Claiming \$50k \$45,000	39	54	67	80	91	101	110	118	124	130	134	137	
\$50,000	40	55	69	81	92	103	111	119	126	131	135	138	
Maiden Allowance \$55,000	41	56	70	82	94	104	113	120	127	132	136	139	
\$60,000	43	57	71	84	95	105	114	122	128	133	138	141	
Open Allowance \$75,000	46	61	75	87	99	109	118	125	132	137	141	144	
\$80,000	48	62	76	89	100	110	119	127	133	138	143	146	
Overnight Stake \$100,000	53	67	81	94	105	115	124	132	138	143	148	151	

Additional Model Insights

- Races taken Off-the-Turf cost 10% in handle after controlling for change in field size
- Restricted races cost 5.3%, c.p.
- The market rewards coordinated (punishes overlapping) posttimes with major simulcast competitors

But we're running low on horses...

- Less Racing? Not a traditional “go-to” solution.
- How to get more starts per horse?
 - Reduce the cost of losing?
- Restricted and Open programs don't intersect, means fewer horses in more races.
 - Entice/Convert restricted runners into Open events.
 - Woodbine open race bonuses: 40% to Ontario-Sired, 20% to Ontario-Bred
- Can the tracks partner on horse supply?
- Elephants at the watering hole.
